

# THE STORY OF NEANNA FALLS

Our first year on Mars wasn't all fun and games, Though we did have some fun, we encountered some problems along the way. But before we tell you about that we should start by telling you a little about our community. Our community is called NEANNA Falls because we put together the last letters of all our group members names and it just happened to spell Neanna, but it sounded kind of plain so we added falls.

We found the perfect spot to settle on the equator in a giant crater. Our crater that we live in is one million square feet and is about 1 mile deep.

We live under a giant reflective dome, made out of extra thin layers of reflective metal that protect us from radiation, dust storms, and holds all of our oxygen so we can breathe. From the outside it looks almost like a mirror, but if you look closely you can see many things inside.

One of our greatest engineering achievements is our entry into our community. The Elevator. Our elevator is on the surface of our community and it goes down under the ground and stops at the door of the community. Then a vacuum sucks out all the carbon dioxide and the door to our community opens so people can come in without letting air out.

We elected Condoleezza Rice to be our Mayor and leader of the city. We picked Condoleezza Rice because we want our community to be like no other and America has never had an African American as our

President or a woman. So we decided to make her president. She seems like a great leader.

In our community we have many tall buildings made out of metal and martian rocks, and streets with cars. The cars in our community are hover crafts and rovers put together. They can fly or if they are on the ground, they have big wheels so they can go over big rocks.

It wasn't long after we arrived on Mars that we encountered our first problem. When we arrived we immediately set up an educational program. The only class the people went to was that mars survival awareness class. The stuff that people were not learning because they were not going to class was just basic stuff that people need to know, BUT it is so important because we want our community to be smart. If our community falls behind in our studies then it will be hard for them to get caught up. Luckily after about a month people began to get settled and began going to their classes.

Everything seemed good until about the sixth month there on Mars. We had a major problem. One of our young 16 year old boys by the name of John Smith figured out a way to invent a drug. Apparently he found out that if you ground up a certain kind of martian rock and mix it with some kind of cleaning chemical you can create a dangerous drug.

John smith was Young tall light skinned boy. He was one of our engineers. It was about three p.m. when he was on his way to work, but before he started his work on the buildings he went to the rest room and one of the community leaders spotted him. When he saw him he was skipping and talking in sentences that didn't make sense and just all kinds of weird stuff.

The community leader noticed his behavior, and so he took him to Condeleeza rice, and they gave him a drug test. ( we thought something like this would happen so we brought one just in case.) He failed the test so we had a community meeting. In the meeting we decided to send him back to Earth because we figured if he did it once then he would do it again.

Our Community has a strict policy of no drugs we put him in a spacecraft that we use to transport our food and sent him back to Earth.

We sent him to Condoleezza Rice and we had a meeting deciding what to do with him. Eventually we had to get rid of him and send him back to earth.

The End
